

PAUL JEON

pauljeon@college.harvard.edu · 781-999-2598 · linkedin.com/in/paul-j-jeon · pjeon18.github.io/pauljeon

I take products from spec to shipped code, usually with an AI agent doing part of the build. Right now I'm building GTM automation at Onapsis.

EDUCATION

Harvard College — A.B. Computer Science, Secondary in Visual Studies

Expected May 2027

Coursework: Planning & Learning Methods in AI · Software Engineering with Generative AI · Data Science · Data Visualization · Data Structures & Algorithms · Probability

SELECTED PRODUCTS

ISO — Real-time dating app · solo (product, design, engineering) 2026

pjeon18.github.io/iso-prototype

- Wrote the PRD and shipped a 31-screen prototype around one hard bet — one conversation at a time — and enforced it in the state layer so the UI can't work around it.
- Gave the product a spine (no inbox, chats end cleanly, monetization never touches matching) and documented every screen in a standalone design doc.

Prep.io — Live “office hours” streaming platform · solo 2026

pjeon18.github.io/prep-io

- Took a “Twitch for careers” idea from PRD to a shipped prototype: browse a fair of live rooms, raise a hand, get pulled to the hot seat — a funnel that only moves with both sides' consent.
- Built a simulated crowd engine (scripted or LLM-driven) that drives live viewer counts, chat, and hand-raises, and shipped the full surface — search, goal-based explore, premium tier — across desktop and mobile.

Org Chart Explorer — Internal tool, shipped to a BDR team · design + engineering

github.com/pjeon18/orgcharexplorer

- Turned a 699-person HR export into a searchable reporting tree that runs entirely in the browser, because the data was never allowed to leave the client; deployed on AWS with a typed model and import validation.

EXPERIENCE

AI Builder / AI GTM Intern — Onapsis, Boston May 2026–Present

- Built an agentic prospecting pipeline (Google Apps Script + ZoomInfo API) that pulled a 13,000-row market into 74 qualified, sourced leads across 47 accounts in one automated run.
- Wrote an LLM scoring step (Gemini) that reads messy job titles, grades each lead with a confidence score, and drops the ones that don't clear the bar before a rep sees them.

Procurement & Automation Manager — The Harvard Shop, Cambridge Sep 2023–Feb 2025

- Ran \$1.8M of inventory across 1,100+ SKUs for three stores and an online shop; built a Python + Lightspeed restock model, and revenue grew 47% (\$370K) at a 65% margin the year it ran.

Director of Growth — Harvard Undergraduate Marketing Group Sep 2025–Feb 2026

- Built a sponsorship tracker where an LLM reads email threads, fills the pipeline, and turns the numbers into recommendations for the board.

TECHNICAL PROJECTS

- F1 undercut model (CS109): labeled 761 pit-stop attempts and trained a weighted logistic regression to 0.71 AUC-ROC on whether an undercut will work.
- Reinforcement & deep learning (CS182): Q-learning agents built from the Bellman equation up (>70% Pac-Man win rate) and a from-scratch CNN (>80% on FashionMNIST).
- Media analytics (CS171): a YouTube Data API pipeline tracking the move to short-form, published as a d3 visualization.

SKILLS

Product: PRDs, roadmapping, user research, prototyping, experimentation, AI agents for PM work

AI / ML: PyTorch, TensorFlow, OpenAI / Anthropic / Gemini APIs, RAG, fine-tuning, prompt engineering

Engineering: Python, TypeScript, React, SQL, C/C++, Tailwind; Git, Figma
